Forex Arbitrage Software - Fully Automated Trading System

Many systems, based on arbitrage (comparison of quotes), have appeared in Internet recently. Our company has carried out in-depth studies in this field. We’ve tested several methods: two-way arbitrage (2 brokers), triangular arbitrage (3 brokers), etc. Such systems can work quite confidently on demo accounts, but during real trade any MT4 failure or interference from broker’s side will result in losing all profit, gained on difference of quotes. Even if you use API and increase speed of receiving ticks and sending orders, it won’t improve the situation.

But any persistently working scalping system can be significantly improved by means of using the arbitrage system. Even 1-2 pips can significantly increase profit of the scalping system. But researches showed that prices of different brokers could differ on 7-10 pips.

Arbitrage System operation principle

Currencies: EURCAD, CADCHF, USDCHF, USDJPY, GBPCAD
Timeframe: M15

Reliable scalping system was taken as a basis. Arbitrage module receives ticks from 2 or 3 brokerage companies in real-time mode (without delays) and compare ticks.

bid/ask	FXOpen-ECN Demo Server vs AlpariUS-Demo	FXOpen-ECN Demo Server vs MIGBank-Demo	AlpariUS-Demo vs MIGBank-Demo
USDJPY	5/-7	5/-7	0/0
USDCHF	6/-7	9/-6	3/1

Brokers are chosen by practical consideration. Ticks are constantly compared, and brokerage companies receive priorities: Prime, Moderate and Inferior.

- The highest priority (Prime) is given to the broker with minimal price for opening buy order.
-
- The highest priority (Prime) is given to the broker with maximal price for opening sell order.

As soon as the advisor gives a signal for opening order, the system will refer to the priority table and will open orders with lot size, specified for every priority in the Money Management block:

For example:

terminalPrimelot=3; - terminal with the highest priority

terminalModerateLot=2; - terminal with average priority

terminalInferiorLot=1; - terminal with the lowest priority

Example of work.

The advisor gave a signal for buying EURUSD; at that moment the price of broker A was 1.4189, the price of broker B was 1.4183, the price of broker C was1.4181.

The priority table will be formed in the following way:

Prime broker - broker C (price: 1.4181)

Moderate broker – broker B (price: 1.4183)

Inferior broker – broker A (price: 1.4189)

Let us assume that we set lot size in the following way:

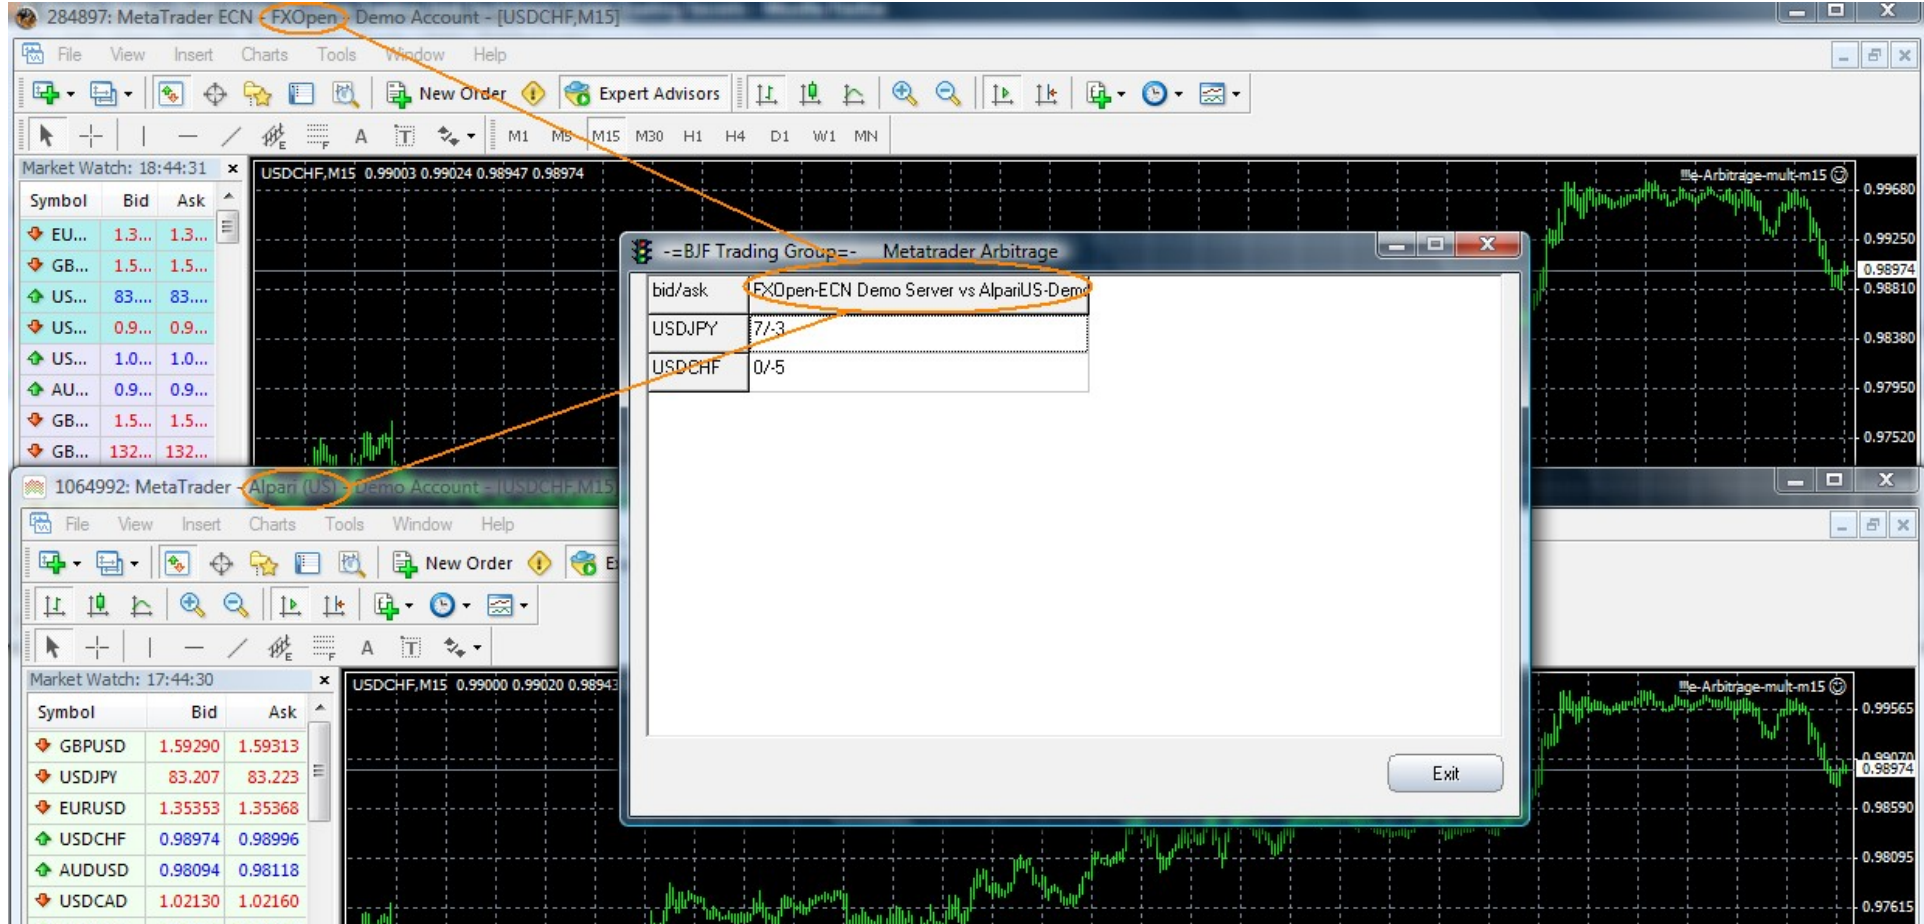

terminalPrimelot=3

terminalModerateLot=2

terminalInferiorLot=0.5;

In this case the system will open order on terminal C with lot size =3, on terminal B with lot size =2, on terminal A with lot size =0.5.

Forex Arbitrage Software allows to use two brokerage companies

or 3 brokerage companies
