TFOT version 8.0 pro - What's New

- Forex robot TFOT pro 8.0 contains two Backpropagation multi-layers neural networks.
- Backpropagation, an abbreviation for "backward propagation of errors", is a common method of training artificial neural networks.
- From a desired output, the network learns from many inputs, similar to the way a child learns to identify a dog from examples of dogs.
- It is a supervised learning method, and is a generalization of the delta rule.
- It requires a dataset of the desired output for many inputs, making up the training set.
- It is most useful for feed-forward networks (networks that have no feedback, or simply, that have no connections that loop).
- Backpropagation requires that the activation function used by the artificial neurons (or "nodes") be differentiable.wikipedia.org.

Trade Copier for High Frequency Strategies

- Currently, high-frequency strategies have grown in popularity.
- But if you're managing multiple accounts or sell forex signals for the convenience you need a copier capable of transmitting the signal without delay on the slave account.
- Trade copiers working on scripts or expert advisors are always has latency about 0.3 -0.5 sec plus execution time on master account and plus execution time on slave account.
- In order to obtain a zero latency, four years ago we have developed PowerTradeCopier.
- This tool has been successfully used by hundreds of forex money managers, forex signal providers, and forex brokers around the world.
- Next we can show you difference between standard copier and PowerTradeCopier.
- Broker execution time explanation.
- When you expert advisor gives the command to open order, or you press button "Open Order" manually, order does not open immediately and goes through four several stages.
